## METHOD OF PAYMENT (check all that apply)

 Check  Credit card  Money Order  Other  None
 Deposit Account:

Deposit Account Number	<input type="text"/>
Deposit Account Name	<input type="text"/>

The Commissioner is authorized to: (check all that apply)

Charge fee(s) indicated below  Credit any overpayments  
 Charge any additional fee(s) during the pendency of this application  
 Charge fee(s) indicated below, except for the filing fee to the above-identified deposit account.

## FEE CALCULATION

## 1. BASIC FILING FEE

Large Entity	Small Entity	Fee Code (\$)	Fee Code (\$)	Fee Description	Fee Paid
1001 750	2001 375	Utility filing fee			
1002 330	2002 165	Design filing fee			
1003 520	2003 260	Plant filing fee			
1004 750	2004 375	Reissue filing fee			
1005 160	2005 80	Provisional filing fee			
SUBTOTAL (1) (\$)					

## 2. EXTRA CLAIM FEES FOR UTILITY AND REISSUE

Total Claims	Independent Claims	Multiple Dependent	Extra Claims	Fee from below	Fee Paid
			-20** =	<input type="text"/> X <input type="text"/> =	<input type="text"/>
			-3** =	<input type="text"/> X <input type="text"/> =	<input type="text"/>
				<input type="text"/> =	<input type="text"/>

Large Entity	Small Entity	Fee Code (\$)	Fee Code (\$)	Fee Description
1202 18	2202 9	Claims in excess of 20		
1201 84	2201 42	Independent claims in excess of 3		
1203 280	2203 140	Multiple dependent claim, if not paid		
1204 84	2204 42	** Reissue independent claims over original patent		
1205 18	2205 9	** Reissue claims in excess of 20 and over original patent		
SUBTOTAL (2) (\$)				

\*or number previously paid, if greater; For Reissues, see above

## 3. ADDITIONAL FEES

Large Entity	Small Entity	Fee Code (\$)	Fee Code (\$)	Fee Description	Fee Paid
1051 130	2051 65	Surcharge - late filing fee or oath

Mail Stop Appeal Briefs - Patents  
Hon. Commissioner for Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

**BRIEF ON APPEAL**

Sir:

This is an appeal from the Final Rejection, dated October 21, 2003, for the above-identified patent application.

**REAL PARTY IN INTEREST**

The present application has been assigned to HRL Laboratories, LLC of Malibu,

CA.

**RELATED APPEALS AND INTERFERENCES**

There are no related appeals or interferences to this application.

**STATUS OF CLAIMS**

Claims 1, 6, 7, 10, 16, 17, 20, and 26 are rejected.

Claims 2-5, 8, 9, 11-15, 18, 19, and 21-25 are objected to.

Claims 27 and 28 are not under any objections or rejections.

1           Claims 1, 6, 7, 10, 16, 17, 20, 26 are the subject of this appeal. A copy of all  
2        claims of the application is contained in the attached Appendix A.

3

## **STATUS OF AMENDMENTS**

5 No Amendment after Final Rejection has been entered.

6

## SUMMARY OF INVENTION

8           A method and apparatus for incorporating decision making into classifiers to  
9   provide efficient test recommendations are presented and claimed. The apparatus  
10   comprises an explicit system and a classifier, each configured to receive a system state  
11   dataset, with the explicit system connected with the classifier, and operative to iteratively  
12   perform a combinatory search procedure based on the system state dataset to develop a  
13   next test recommendation for the classifier, whereby the classifier performs the next test  
14   to generate an objective weighted score. The system state dataset is typically in the form  
15   of a vector representing the various features that describe the System State. The  
16   apparatus further includes a profit module connected with the classifier and with the  
17   explicit system to receive the objective weighted score from the classifier, to add  
18   subjective value to the objective weighted score to determine a profit for the test, and to  
19   provide the profit to the explicit system to enable the explicit system to assess the value  
20   of its next test recommendation, and, iteratively, to generate a best test recommendation  
21   based on the maximization of the profit. The apparatus further includes an implicit  
22   system configured to receive a system state dataset, and connected with the explicit  
23   system to receive the best test recommendation for each system state dataset, and to act as

1 a function estimator to learn to associate best test recommendations with the system state  
2 dataset in order to mimic the explicit system, thereby to enable rapid decision making in  
3 situations that are either urgent or well-known.

4

5 Although the implicit system may be any probability-based learning system, it is  
6 preferably a neural network. The combinatory search procedure performed by the  
7 explicit system is preferably simulated annealing.

8

9 After the implicit system has been sufficiently trained to mimic the explicit system, the  
10 explicit system and the profit module may be separated from the implicit system in order  
11 to provide a smaller, lower cost system that approximates the performance of the overall  
12 system. This application is especially useful when the system is dealing with a fixed  
13 environment, i.e. there are few changes that would be outside the range in which the  
14 implicit system was trained.

15

16 **ISSUES**

17 Issue 1 - Whether Claims 7, 17, and 26 lack compliance with 35 USC 112, fourth  
18 paragraph, in that these claims fail to additionally limit the subject matter of the related  
19 independent claim.

20 Issue 2 – Whether Claims 1 and 20 and Claims 6 and 16 are indefinite under 35  
21 USC 112, second paragraph, for failing to particularly point out and distinctly claim the  
22 subject matter which Appellant regards as the invention. In particular, whether the terms

1    “mimic” as used in Claims 1 and 20, and “sufficiently mimics” as used in Claims 6 and  
2    16, are relative terms that render the claims indefinite.

3              Issue 3 - Whether Claim 10 is indefinite under 35 USC 112, second paragraph, for  
4    failing to particularly point out and distinctly claim the subject matter which Appellant  
5    regards as the invention. In particular, whether the preposition “on” used in Claim 10 is  
6    confusing.

7              **GROUPING OF CLAIMS**

8              The grounds of rejections and objections which appellant contests herein apply to  
9    more than one claim, such additional claims, to the extent separately identified and  
10   argued below, do not stand or fall together.

11              **THE ARGUMENT**

12              ***Issue 1 - Whether Claims 7, 17, and 26 lack compliance with 35 USC 112, fourth paragraph, in that these claims fail to additionally limit the subject matter of the related independent claim.***

15

16    Claims 7 recites:

17              *An apparatus for incorporating decision making into classifiers to provide  
18    efficient test recommendations as set forth in claim 1, wherein the System State is a  
19    vector.*

20

21    Claim 17 recites:

1        *A computerized method for enhancing decision making into classifiers to provide*  
2    *efficient test recommendations as set forth in claim 10, wherein the System State is a*  
3    *vector.*

4

5    Claim 26 recites:

6        *A computerized method for enhancing decision making in classifiers to provide*  
7    *efficient test recommendations as set forth in claim 20, wherein the System State is a*  
8    *vector.*

9

10        In the first Office Action dated May 7, 2003, the Examiner objected to Claims 7,  
11   17, 26 under 37 CFR 1.75(c) for lack of compliance with 35 USC 112, fourth paragraph,  
12   in that these claims fail to additionally limit the subject matter of the related independent  
13   claim. The Examiner stated that “*by definition, the system state is always a vector.*”

14

15        In the Response to the first Office Action dated May 7, 2003, the Appellant stated  
16   that “[t]he first partial paragraph on page 19 of the present application states, “*Note*  
17   *that representing the problem as a vector is appropriate only when the test costs are not*  
18   *affected by which other tests have already been performed.*” Thus, it is not true that the  
19   *system state is always a vector as asserted by the Examiner. Therefore, the Applicant*  
20   *submits that Claims 7, 17, and 26 are in compliance with 35 USC 112, fourth paragraph,*  
21   *as they additionally limit the subject matter of the related independent claim. If the*  
22   *Examiner still maintains his objection to these claims, the Applicant respectfully requests*

1    *that the Examiner point out to the Applicant his basis for his interpretation that, by*  
2    *definition, the system state is always a vector.”*

3

4        In the Final Office Action of October 21, 2003, the Examiner finally objected to  
5    claims 7, 17, and 26 under 37 C.F.R. 1.75(c) for lack of compliance with 35 U.S.C. 112,  
6    fourth paragraph. The Examiner stated that “*these claims fail to additionally limit the*  
7    *subject matter of the related independent claim in that by definition the system state is*  
8    *always a vector.*” In response to the Appellant's arguments and a request that the  
9    Examiner elaborate and clarify his basis for the objection in the First Office Action dated  
10   May 7, 2003, the Examiner further stated that “[*t*]o one of ordinary skill in the art, the  
11   *system state is defined by n coordinates in Euclidean n-space. A vector is a well-known*  
12   *mathematical concept defined by n coordinates in Euclidean n-space. The well accepted*  
13   *methodology of vectors is commonly used to refer to the n coordinates of the system state*  
14   *in Euclidean n-space.*”

15

16   The following are direct quotes regarding the term “vector” used throughout the  
17   disclosure:

18

19   Page 17, line 22 to page 18, line 5 states:

20        *In the context of choosing the best subset of tests, a local search algorithm starts*  
21   *out at some state, typically in the form of a vector with an entry for each test indicating*  
22   *whether or not the given test is to be performed. The local search algorithm changes*

1    *entries in the vector to indicate whether the test will be run, and accepts a change when*  
2    *the expected profit rises.*

3

4            As the above quoted section clearly indicates, the system state is *typically* in the  
5    form of a vector, and therefore is not limited to a vector form of representation.

6

7    Page 19, lines 3 to 9 state:

8            *"Note that representing the problem as a vector is appropriate only when the test*  
9    *costs are not affected by which other tests have already been performed. FIG. 3(b)*  
10   *represents a problem in which test costs are affected by which other tests have already*  
11   *been performed. In such cases, optimization occurs over a matrix."*

12

13           The Appellant respectfully disagrees with the Examiner's assertion that the  
14   system state is always a vector, and particularly the belief that the System State is defined  
15   by n coordinates in Euclidean n-space. The System State of the present application  
16   cannot simply be described as a vector, with values that are known and unknown. The  
17   System State is in actuality much more broad in its scope, and can include multiple test  
18   dependencies which exist outside of the simple bounds of a vector. As stated on page 19,  
19   lines 3 to 9, *"[n]ote that representing the problem as a vector is appropriate only when*  
20   *the test costs are not affected by which other tests have already been performed."* This  
21   describes the situation in which a test dependency would exist that would bring the  
22   System State outside of the traditional definition of a vector. Essentially, when the  
23   system is searching for the next test to evaluate, it must navigate a matrix structure for

1 situations in which there are test dependencies. The state of the search process is part of  
2 the System State, and therefore cannot be limited to the definition of a simple vector,  
3 which is limited to known and unknown values. Appendix B includes a declaration by  
4 the inventor, one of ordinary skill in the art, as to the interpretation of the System State as  
5 more than a simple vector. Furthermore, the complete System State of the model can  
6 additionally encompass the specification of the classifier, the implicit system, and the  
7 explicit system. Thus, the System State is not defined by n coordinates in Euclidean n-  
8 space, but is subject to a much broader interpretation.

9

10 Based on the prior comments regarding the definition and scope of the System  
11 State, Appellant believes that Claims 7, 17, and 26 are in compliance with 35 USC 112,  
12 fourth paragraph, as they additionally limit the subject matter of the related independent  
13 claim.

14

15 ***Issue 2 – Whether Claims 1 and 20 and Claims 6 and 16 are indefinite under 35***  
16 ***USC 112, second paragraph, for failing to particularly point out and distinctly claim***  
17 ***the subject matter which Appellant regards as the invention. In particular, whether the***  
18 ***terms “mimic” as used in Claims 1 and 20, and “sufficiently mimics” as used in***  
19 ***Claims 6 and 16, are relative terms that render the claims indefinite.***

20

21 Claim 1 recites, inter alia:

22 “*...an implicit system configured to receive a system state dataset, and connected*  
23 *with the explicit system to receive the best test recommendation for each system state*

1    *dataset, and to act as a function estimator to learn to associate best test*  
2    *recommendations with the system state dataset in order to mimic the explicit system,*  
3    *thereby to enable rapid decision making in situations that are either urgent or well-*  
4    *known.”*

5

6    Claim 20 recites, inter alia:

7    *“...providing an implicit system configured to receive a system state dataset, and*  
8    *connected with the explicit system to receive the best test recommendation for each*  
9    *system state dataset, and to act as a function estimator to learn to associate best test*  
10    *recommendations with the system state dataset in order to mimic the explicit system,*  
11    *thereby to enable rapid decision making in situations that are either urgent or well-*  
12    *known.”*

13

14    In the first Office Action dated May 7, 2003, the Examiner rejected Claims 1 and  
15    20 under 35 USC 112, second paragraph, as being indefinite for failing to particularly  
16    point out and distinctly claim the subject matter which Appellant regards as the invention.  
17    The Examiner stated that “*At Claim 6, line 4 the term “mimic” is used which is a relative*  
18    *term and renders the [sic]claim indefinite.*”

19

20    Appellant believes the Examiner has made an error in arguing claim 6 under the  
21    35 USC 112, second paragraph, rejection of claims 1 and 20. The term “mimic” appears  
22    in paragraph “c” of both claims 1 and 20. In Response to the First Office Action, the

1      Appellant respectfully disagreed with the Examiner, and stated that “[t]he present  
2      application, page 16, lines 15-17 states “Although the explicit system 202 uses a  
3      combinatorial process to determine the best test or tests to run, over time the implicit  
4      system 206 learns to mimic the performance of the explicit system 202.” The Applicant is  
5      unclear why the Examiner has asserted that the term “mimic” is relative. The Applicant  
6      respectfully requests that if the Examiner continues this rejection of Claims 1 and 20  
7      based on the term “mimic” that the Examiner explain why he believes the term is  
8      relative. Because the term “mimic” is used in a definable context in the present  
9      application, the Applicant submits that one skilled in the art would understand what the  
10     term “mimic” means and thus, the term “mimic” is not indefinite. Therefore, the  
11     Applicant respectfully requests that the Examiner withdraw this rejection of Claims 1 and  
12     20.”

13

14        In the Final Office Action, dated October 21, 2003, the Examiner finally rejected  
15     Claims 1 and 20 under 35 USC 112, second paragraph, as being indefinite for failing to  
16     particularly point out and distinctly claim the subject matter which the Appellant regards  
17     as the invention. The Examiner stated that “...To one of ordinary skill in the art, the term  
18     “mimic” introduces the concept of imitation and with the concept of imitation comes the  
19     question of “how much”? Since such a term introduces a sliding scale of interpretation,  
20     by consequence the claim is indefinite.”

21

22     Claim 6 recites:

1       *"An apparatus for incorporating decision making into classifiers to provide*  
2       *efficient test recommendations as set forth in claim 5, wherein the explicit system and the*  
3       *profit module may be separated from the apparatus after the implicit system sufficiently*  
4       *mimics the explicit system."*

5

6       Claim 16 recites:

7       *"A computerized method for enhancing decision making in a classifier system as*  
8       *set forth in claim 15, wherein the explicit system and the profit module used may be*  
9       *separated from the classifier system after the implicit system sufficiently mimics the*  
10      *explicit system."*

11

12      In the first Office Action, dated May 7, 2003, the Examiner rejected Claims 6 and  
13     16 under 35 USC 112, second paragraph, as being indefinite for failing to particularly  
14     point out and distinctly claim the subject matter which Appellant regards as the invention.

15      The Examiner stated that "*At Claim 6, line 4 the term "sufficiently mimics" is used which*  
16      *is a relative term and renders the claims indefinite. Claim 16 has a similar reference.*"

17

18      In Response to the First Office Action, the Appellant respectfully disagreed with  
19     the Examiner, and stated that "*The Applicant disagrees for the same reasons given above*  
20     *with reference to claims 1 and 20. Therefore, the Applicant respectfully requests that the*  
21     *Examiner withdraw this rejection of claims 6 and 16.*"

22

1 The following are direct quotes regarding the term “mimic” used throughout the  
2 disclosure:

3

4 Page 16, lines 14+:

5 *“Although the explicit system 202 uses a combinatorial process to determine the best test*  
6 *or tests to run, over time the implicit system 206 learns to mimic the performance of the*  
7 *explicit system 202. In situations that are familiar or when a very fast approximation to*  
8 *the performance of the explicit system 202 is required, the implicit system can be used to*  
9 *provide the final decision. In cases where there are a limited number of possible*  
10 *situations, the explicit system 202 may be removed after the implicit system 206 has been*  
11 *fully trained.”*

12

13 Page 20, lines 15+:

14 *“The implicit system compliments the explicit system by providing almost instantaneous*  
15 *test recommendations. The implicit subsystem is a function approximator that, over time,*  
16 *learns to approximate the performance of the explicit system. Thus, the explicit system*  
17 *provides the teaching signal for the implicit system, which will be discussed in greater*  
18 *detail further below.”*

19

20 Page 26, lines 4+:

21 *“In time critical situations, the implicit system can be queried, while the explicit system*  
22 *can be queried when time is not of the essence. When processor load is low, the explicit*  
23 *system can provide training data to refine the implicit system. In an alternative*

1 *embodiment, such as a deployed system with limited processing power, the implicit*  
2 *system can be completely trained by the explicit system while off-line, and the present*  
3 *invention may be deployed without the explicit system.”*

4

5 Page 27, lines 1-3:

6 *“After some training, this input/output mapping closely approximates the output of the*  
7 *explicit system, but requires less computation.”*

8

9 Appellant asserts that the term “mimic” is not relative to the point that the claims  
10 are rendered indefinite. To one of ordinary skill in the art, the notion of a learning model  
11 coming to approximate, estimate, or mimic some underlying function is accepted in  
12 machine learning and statistics (See Appendix B). In the present invention, the function  
13 being approximated is the one defined by the input/output mapping of the explicit system,  
14 as stated in the application on page 20, lines 15 – 19 (see *infra* page 12). In each  
15 application of the learning model, there will be different costs associated with gathering  
16 training data, making timely predictions, and making errors. The present invention  
17 provides for these varying costs by adjusting the amount of the explicit system to be  
18 mimicked by the implicit system, as stated in the disclosure on page 16, lines 14 – 20 and  
19 page 26, lines 4 – 9 (see *infra* page 12). Thus, what constitutes adequate mimicry cannot  
20 be defined outside of the context of a specific application, since the costs associated with  
21 gathering the data, processing the information, and making accurate predictions will vary  
22 for each application. While mimicking the outputs of the system 60% of the time may be  
23 sufficient in some situations, matching the outputs 99.9% of the time may be inadequate

1 in others. Therefore, to be specific as to the amount of mimicry occurring would be  
2 unnecessarily limiting, as the amount of mimicry varies depending on the type and  
3 amount of data and the desire for efficiency based upon the resources available to the  
4 system at any time.

5

6 Appellant thus believes that the terms “mimic,” as used in Claims 1 and 20, and  
7 “sufficiently mimics”, as used in Claims 6 and 16 is not indefinite under 35 USC 112,  
8 second paragraph, for the reasons discussed above.

9

10 ***Issue 3 - Whether Claim 10 is indefinite under 35 USC 112, second paragraph,***  
11 ***for failing to particularly point out and distinctly claim the subject matter which***  
12 ***Appellant regards as the invention. In particular, whether the preposition “on” used in***  
13 ***Claim 10 is confusing.***

14

15 Claim 10 recites:

16 “A computerized method for enhancing decision making in a classifier system,  
17 wherein the classifier system includes an explicit system and a classifier, each configured  
18 to receive a system state dataset, with the explicit system connected with the classifier; a  
19 profit module connected with the classifier and with the explicit system; and an implicit  
20 system configured to receive a system state dataset, and connected with the explicit  
21 system, the computerized method comprising the steps of:

22 a. receiving a system state dataset in the explicit system, the classifier, and the  
23 implicit system;

1           *b. determining in the explicit system, based on the feature set, a recommended*  
2           *test;*

3           *c. performing the recommended test on the classifier;*

4           *d. determining, via the profit module, the profit from the test performed on the*  
5           *classifier;*

6           *e. detecting whether the test performed on the classifier maximizes the profit;*

7           *f. performing the receiving step a through the detecting step e until a test is found*  
8           *which maximizes the profit;*

9           *g. training the implicit system with the system state dataset and the test which*  
10           *maximizes the profit; and*

11           *h. repeating steps a through g until a desired level of training of the implicit*  
12           *system is reached."*

13

14        In the First Office action, dated May 7, 2003, the Examiner rejected Claim 10  
15        under 35 USC 112, second paragraph, as being indefinite for failing to particularly point  
16        out and distinctly claim the subject matter which Appellant regards as the invention. The  
17        Examiner stated that “[a]t Claim 10, lines 10-13, the use of the preposition “on” is  
18        confusing [sic]it is really the classifier that is evaluating the test...perhaps the word “by”  
19        could be used as a replacement. Without such change, the claim is indefinite.”

20

21        In Response to the First Office Action, the Appellant stated that “*The last*  
22        *paragraph on page 15 of the present application states, 'The explicit system 202 runs*

1 *virtual or hypothetical tests on the classifier 200, which, in essence, acts as a model of*  
2 *the world in which the system operates.'* Thus, as disclosed in the present application,  
3 *the tests are preformed on the classifier. The Applicant submits that the use of the*  
4 *preposition "on" is appropriate in this case. Therefore, the Applicant respectfully*  
5 *requests that the Examiner withdraw this rejection to Claim 10."*

6

7 In the Final Office Action, dated October 21, 2003, the Examiner finally rejected  
8 Claim 10 under 35 USC 112, second paragraph, as being indefinite for failing to  
9 particularly point out and distinctly claim the subject matter which Appellant regards as  
10 the invention. The Examiner repeated the reasoning given in First Office Action, and  
11 further stated that "...[s]pecification, Fig. 2 applies. Note that the Explicit System is  
12 separate and distinct from that of the Classifier. This means that the Classifier will run  
13 the recommended test. Hence, the word "by" is correct. These comments apply to steps  
14 c, d, and e of claim 10. See also claim 1, step a wherein 'classifier performs.'"

15

16 The following are direct quotes regarding the term "on" with respect to the classifier used  
17 throughout the disclosure:

18

19 Page 15, lines 20+:

20 "*The explicit system 202 runs virtual or hypothetical tests on the classifier 200, which, in*  
21 *essence, acts as a model of the world in which the system operates.*"

22

23 Page 16, lines 2-9:

1    *"The profit module 204 tempers the output of the classifier 200 in order to add subjective*  
2    *cost information relative to the set of tests performed in order to determine the profit*  
3    *received by performing the set of tests, i.e. output of the profit module 204 reflects the*  
4    *fact that with each test, there is an associated cost, and that accuracy must be sacrificed*  
5    *if the cost of the test is simply too high to bear. The output of the profit module 204 is*  
6    *provided to the explicit system 202 so that the explicit system 202 may use the feedback to*  
7    *set benchmarks en route to maximizing the profit from the tests. After performing a set of*  
8    *tests based on the feature set input, the explicit system 202 reaches a final decision of the*  
9    *best test or tests to run."*

10

11    Page 25, lines 5-8:

12    *"The classifier 200 is used essentially as a model of the task environment, or world, with*  
13    *experiments being run on the classifier to make predictions about what will transpire in*  
14    *the actual environment. The more veridical the classifier 200 is, the more accurate its*  
15    *predictions will be."*

16

17    Page 26, lines 21+:

18    *"In effect, the classifier is used as a model of the task environment and the present*  
19    *invention runs experiments on this model to determine what action to perform next."*

20

21       The present application discloses in Claim 10 and throughout the disclosure that  
22       the Explicit System performs the recommended test on the Classifier. Specifically, where  
23       Claim 10 states in steps b and c, "b. determining in the explicit system, based on the

1 feature set, a recommended test; c. performing the recommended test on the classifier;”  
2 the implication of these sections of the claim is that the Explicit System determines a  
3 recommended test and thereafter performs the recommended test on the Classifier. The  
4 steps of the Explicit System performing a test upon the Classifier are further described in  
5 the specification at Page 15, line 20 – 21, which explains how “[t]he explicit system **202**  
6 runs virtual or hypothetical tests on the classifier **200**, which, in essence, acts as a model  
7 of the world in which the system operates.” While the Examiner cites to Fig. 2 of the  
8 Specification for the assertion that the Explicit System is separate and distinct from the  
9 Classifier, this does not refute the fact that the Explicit System still performs the  
10 recommended test on the Classifier as denoted in Claim 10 and throughout the above-  
11 referenced sections of the specification.

12 In Claim 1, step a, which states “an explicit system and a classifier each  
13 configured to receive a system state dataset, *with the explicit system connected with the*  
14 *classifier, and operative to iteratively perform a combinatory search procedure based on*  
15 *the system state dataset to develop a next test recommendation for the classifier*, whereby  
16 the classifier performs the next test to generate an objective weighted score;” (italics not  
17 present in original), the Explicit System is described as connected with the Classifier,  
18 where the Explicit System functions to run a test to determine the appropriate test to run  
19 on the Classifier, with the Classifier thereafter performing the test part of providing the  
20 output of the test to generate the objective weighted score. While admittedly confusing  
21 in that the Claim can be interpreted to see the Classifier performing the entire  
22 recommended test from the Explicit System, in actuality, the test is performed by the  
23 Explicit System on the Classifier, and part of the test “performed” by the Classifier is

1 only the output of the objective weighted score and essentially the profit from the test  
2 performed.

3

4 In conclusion, the use of the word “on” in Claim 10 is consistent with the  
5 specification and the overall model of the present invention, in that the Explicit System  
6 performs the recommended test on the Classifier in order to provide the Classifier with a  
7 profit and cost estimate of performing the actual test in the real world. While the  
8 Classifier “performs” the function of assembling the profit from the test performed, the  
9 overall test is performed by the Explicit System “on” the Classifier to eventually  
10 determine which test maximizes the profit and thus which test to then recommend to the  
11 Implicit System. Thus, the use of the word “on” is appropriate.

12

13 Claim 10 therefore satisfies the requirements of 35 USC 112, second paragraph.

14

15

19

20

21

22

23

## CONCLUSION

2 For the extensive reasons advanced above, the Appellant respectfully contends  
3 that each claim is patentable. Therefore, reversal of all rejections and objections is  
4 courteously requested at this time.

## CLAIMS

4 What is claimed is:

5

6 1. An apparatus for incorporating decision making into classifiers to provide efficient  
7 test recommendations, the apparatus comprising:

8 a. an explicit system and a classifier each configured to receive a system state  
9 dataset the explicit system connected with the classifier and operative to  
10 iteratively perform a combinatory search procedure based on the system state  
11 dataset to develop a next test recommendation for the classifier, whereby the  
12 classifier performs the next test to generate an objective weighted score;

13 b. a profit module connected with the classifier and with the explicit system  
14 to receive the objective weighted score from the classifier, to add subjective  
15 value to the objective weighted score to determine a profit for the test, and to  
16 provide the profit to the explicit system to enable the explicit system to i.  
17 assess the value of its next test recommendation and ii. to iteratively generate  
18 a best test recommendation based on the maximization of the profit;

19 c. an implicit system configured to receive a system state dataset, and  
20 connected with the explicit system to receive the best test recommendation for  
21 each system state dataset, and to act as a function estimator to learn to  
22 associate best test recommendations with the system state dataset in order to  
23 mimic the explicit system, thereby to enable rapid decision making in  
24 situations that are either urgent or well-known.

25

26 2. An apparatus for incorporating decision making into classifiers to provide efficient  
27 test recommendations as set forth in claim 1, wherein the explicit system and the  
28 implicit system are configured to provide test recommendations to a controller.

29

1       3. An apparatus for incorporating decision making into classifiers to provide efficient  
2       test recommendations as set forth in claim 1, wherein the implicit system is a neural  
3       network.

4

5       4. An apparatus for incorporating decision making into classifiers to provide efficient  
6       test recommendations at set forth in claim 3, wherein the neural network is a radial  
7       basis neural network.

8

9       5. An apparatus for incorporating decision making into classifiers to provide efficient  
10      test recommendations as set forth in claim 3, wherein the combinatory search  
11      procedure performed by the explicit system is simulated annealing.

12

13      6. An apparatus for incorporating decision making into classifiers to provide efficient  
14      test recommendations as set forth in claim 5, wherein the explicit system and the  
15      profit module may be separated from the apparatus after the implicit system  
16      sufficiently mimics the explicit system.

17

18      7. An apparatus for incorporating decision making into classifiers to provide efficient  
19      test recommendations as set forth in claim 1, wherein the system state is a vector.

20

21      8. An apparatus for incorporating decision making into classifiers to provide efficient  
22      test recommendations as set forth in claim 1, wherein the classifier is a probabilistic  
23      model.

24

25      9. An apparatus for incorporating decision making into classifiers to provide efficient  
26      test recommendations as set forth in claim 8, wherein the classifier is Bayesian.

27

28      10. A computerized method for enhancing decision making in a classifier system,  
29       wherein the classifier system includes an explicit system and a classifier, each

1       configured to receive a system state dataset, with the explicit system connected with  
2       the classifier; a profit module connected with the classifier and with the explicit  
3       system; and an implicit system configured to receive a system state dataset, and  
4       connected with the explicit system, the computerized method comprising the steps of:

- 5           a. receiving a system state dataset in the explicit system, the classifier, and the  
6           implicit system;
- 7           b. determining in the explicit system, based on the feature set, a recommended  
8           test;
- 9           c. performing the recommended test on the classifier;
- 10          d. determining, via the profit module, the profit from the test performed on the  
11          classifier;
- 12          e. detecting whether the test performed on the classifier maximizes the profit;
- 13          f. performing the receiving step a through the detecting step e until a test is found  
14          which maximizes the profit;
- 15          g. training the implicit system with the system state dataset and the test which  
16          maximizes the profit; and
- 17          h. repeating steps a through g until a desired level of training of the implicit  
18          system is reached.

19

20       11. A computerized method for enhancing decision making in a classifier system as set  
21       forth in claim 10, wherein the test that maximizes the profit is provided by either the  
22       explicit system or the implicit system to a controller.

23

24       12. A computerized method for enhancing decision making in a classifier system as set  
25       forth in claim 10, wherein the implicit system used is a neural network.

26

27       13. A computerized method for enhancing decision making in a classifier system as set  
28       forth in claim 12, wherein the implicit system used is a radial basis neural network.

1

2 14. A computerized method for enhancing decision making in a classifier system as set  
3 forth in claim 12, wherein the determining step b is performed by the explicit system  
4 using a combinatory search procedure.

5

6 15. A computerized method for enhancing decision making in a classifier system as set  
7 forth in claim 14, wherein the combinatory search procedure performed by the  
8 explicit system in the determining step b is simulated annealing.

9

10 16. A computerized method for enhancing decision making in a classifier system as set  
11 forth in claim 15, wherein the explicit system and the profit module used may be  
12 separated from the classifier system after the implicit system sufficiently mimics the  
13 explicit system.

14

15 17. A computerized method for enhancing decision making into classifiers to provide  
16 efficient test recommendations as set forth in claim 10, wherein the system state is a  
17 vector.

18

19 18. A computerized method for enhancing decision making into classifiers to provide  
20 efficient test recommendations as set forth in claim 10, wherein the classifier is a  
21 probabilistic model.

22

23 19. A computerized method for enhancing decision making into classifiers to provide  
24 efficient test recommendations as set forth in claim 18, wherein the classifier is  
25 Bayesian.

26

27 20. A computerized method for enhancing decision making in classifiers to provide  
28 efficient test recommendations, the computerized method comprising the steps of:

- 1                   a. providing an explicit system and a classifier each configured to receive a  
2                   system state dataset, with the explicit system connected with the classifier,  
3                   and operative to iteratively perform a combinatory search procedure based on  
4                   the system state dataset to develop a next test recommendation for the  
5                   classifier, whereby the classifier performs the next test to generate an  
6                   objective weighted score;
- 7                   b. providing a profit module connected with the classifier and with the  
8                   explicit system to receive the objective weighted score from the classifier, to  
9                   add subjective value to the objective weighted score to determine a profit for  
10                  the test, and to provide the profit to the explicit system to enable the explicit  
11                  system to assess the value of its next test recommendation, and, iteratively, to  
12                  generate a best test recommendation based on the maximization of the profit;
- 13                  c. providing an implicit system configured to receive a system state dataset, and  
14                  connected with the explicit system to receive the best test recommendation for  
15                  each system state dataset, and to act as a function estimator to learn to  
16                  associate best test recommendations with the system state dataset in order to  
17                  mimic the explicit system, thereby to enable rapid decision making in  
18                  situations that are either urgent or well-known.

19

20        21. A computerized method for enhancing decision making in a classifier system as set  
21        forth in claim 20, wherein the explicit system and the implicit system are further  
22        configured to provide the test recommendation to a controller.

23

24        22. A computerized method for enhancing decision making in a classifier system as set  
25        forth in claim 20, wherein the implicit system provided is a neural network.

26

27        23. A computerized method for enhancing decision making in a classifier system as set  
28        forth in claim 22, wherein the implicit system provided is a radial bias neural  
29        network.

1

2 24. A computerized method for enhancing decision making in a classifier system as set  
3 forth in claim 22, wherein the explicit system provided performs the combinatory  
4 search procedure by use of simulated annealing.

5

6 25. A computerized method for enhancing decision making in a classifier system as set  
7 forth in claim 24, wherein the explicit system provided and the profit module  
8 provided may be separated from the classifier system provided after the implicit  
9 system sufficiently mimics the explicit system.

10

11 26. A computerized method for enhancing decision making in classifiers to provide  
12 efficient test recommendations as set forth in claim 20, wherein the system state is a  
13 vector.

14

15 27. A computerized method for enhancing decision making in classifiers to provide  
16 efficient test recommendations as set forth in claim 20, wherein the classifier is a  
17 probabilistic model.

18

19 28. A computerized method for enhancing decision making in classifiers to provide  
20 efficient test recommendations as set forth in claim 27, wherein the classifier is  
21 Bayesian.

## APPENDIX B

2

## DECLARATION OF INVENTOR BRADLEY C. LOVE

3

4 I, Bradley C. Love, of Austin, Texas, am the inventor for application 09/686,112,  
5 the "Method and Apparatus for Incorporating Decision Making into Classifiers." I am an  
6 assistant professor at the University of Texas at Austin in the Center for Computation and  
7 Cognitive Processes, with a Ph.D. in Cognitive Psychology and a B.S. in Cognitive and  
8 Linguistic Sciences. I have worked in the area of computer science and cognitive  
9 processes for over 10 years, with numerous grants and publications in the field. I do  
10 hereby declare the following:

11

12 A Vector is not the most natural way to represent the subject matter of the present  
13 application. The system state of the present application is not confined to values that are  
14 known and unknown. Many cases require searching for the next test by navigating a  
15 matrix structure for situations in which there are test dependencies. The state of the  
16 search process is thus part of the system state. Additionally, the complete state of the  
17 model could encompass the above, plus the specification of the classifier, the implicit  
18 system, and explicit system.

19

20 With regard to the use of the word "mimic," the notion of a learning model  
21 coming to approximate, estimate, or mimic some underlying function is accepted in  
22 machine learning and statistics. For example, gradient descent models, such as error-  
23 minimizing neural networks, come to approximate or mimic an underlying function over

1 the course of learning. In the present application, the function being approximated is the  
2 one defined by the input/output mapping of the explicit system. What constitutes a  
3 sufficient approximation or adequate mimicry cannot be defined outside of the context of  
4 a specific application and evaluation metric. Each application will have different costs  
5 associated with gathering training data, making timely predictions, and making errors.  
6 All of these factors (and more) affect what is adequate mimicry. Matching the outputs of  
7 a system 60% of the time may be adequate in some situations, whereas matching 99.9%  
8 may be inadequate for other applications. In cases where time is of the essence and the  
9 explicit system cannot respond fast enough, any prediction may be desirable. Learning  
10 theoreticians working in the PAC (Probably Approximately Correct) learning framework  
11 formally specify the probability that an estimation will fall outside certain error bounds  
12 given a certain number of training examples for certain classes of problems, but these  
13 analyses are not applicable to many practical situations, nor do they dictate what the  
14 bounds should be (as discussed above).
